

Installation

The SC2160W Wireless Imager is easy to install and use. Please see the following figure showing the steps to perform the installation.

* **Note:** Turn off the host computer before installation.

1. Connect the interface (I/F) cable to the cradle.
2. Connect the power cord to the cradle.
3. Route the I/F cable and power cord through the notch.
4. Connect the I/F cable to the host computer communication port.
5. Connect the AC adapter to the wall outlet.
6. Place the imager in the cradle and verify the charge LED is flashing. Charge the battery for at least 8 hours before the first use.
7. To verify operation, please link the imager with cradle first (Refer to "Wireless Connection" in page 6). Point the imager at the barcode and pull the trigger. The imager should emit a beep indicating that the barcode has been scanned and transmitted to the cradle successfully.

How To Scan

1. The imager must be pointed at slight angle to the barcode so that the light reflected off the barcode can be seen by the imager. Do not hold the imager perpendicular to the barcode.

2. The scan line must cross the entire barcode. The imager can not read the barcode data without seeing the entire barcode.

Troubleshooting

If the imager can not operate properly, the following checks should be performed:

1. The cradle uses an external power supply and the external power supply has failed, the imager will not operate. Change the power supply with a known good power supply and reset the imager.

2. Verify the interface cable is securely connected to the host computer. Consult your technical support personnel or refer to your host system manual to verify the proper connection for the imager.

3. Verify the interface cable is securely connected to the cradle.

4. Check that the barcodes are of sufficient quality to be recognized by the imager. Wrinkled, smudged, or torn labels will cause the imager to not read at all. Scan a known good label to check the imager's read operation.

5. Ensure that the cradle's interface type is compatible with the host computer by consulting your host system manual.

Wireless Connection

Linking the imager with the cradle

Follow these instructions to link the two devices:

1. Connect power to the cradle. The radio LED (marked with a light symbol) will blink amber and the cradle will beep.
2. To ensure the cradle is unlinked from any other imager, check if the cradle send inquiry beep or not (see Inquiry Beep Control in page 18).
3. Read the link label on the bottom of the cradle with the imager. The imager will sound a good read beep and the LED will flash amber.
4. Re-place the imager in the cradle to continue the charge.

Once an imager is linked to a cradle, they will remain linked until specific action is taken to unlink them (see Unlinking). They will remain linked if the cradle is unplugged, if the battery is removed from the imager or if the entire charge is used up, and if the imager is taken out of range of the cradle. Under normal operation, scanning of the link label will only be required once in the life of the product.

Unlinking

There are three ways to unlink an imager from a cradle:

Force imager to disconnect and sleep

1. **Scan the “Force imager to disconnect and sleep” barcode** – Reading the unlink barcode above while the imager is in range of the cradle will break the link between the two devices and allow another imager to link to the cradle. It will also have the imager in **Deep Sleep Mode**. If the barcode is read when the imager is out of range of its linked cradle, the imager will unlink, but the cradle will remain linked to the imager and will not allow another imager to be linked to it. In this case, you may perform the item 2 below to link another imager.
2. **Scan the Link Label and put on the original cradle** – If the cradle is linked with an imager and the original pair was stopped by out of range of the cradle or out of battery of the imager, scan the link label of the cradle with a new imager and then put on the cradle, the cradle will drop the original pair and establish a new link with the new imager.
3. **Scan the Link Label on an alternate cradle** – Scanning the link label on a cradle will drop the link between the original pair and establish a link between the imager and new cradle. If the new link is performed within range of the old cradle, it is free to establish a link to the next imager that reads its link label. If it is done outside of the range of the old cradle, it retains its old link and will not allow a new imager to link to it until a new imager scan the link label and put on the cradle.

Battery Charging

The imager contains a 1000mAh Lithium-Ion rechargeable battery. A full charged battery will provide up to 15,000 scans over a 12 hours period. Actual charge life on the imager will depend on the configuration of how the imager is configured via the programmable feature in this manual; in particular, **Deep Sleep Mode** settings can impact battery life.

When the imager is placed in the cradle, the battery will automatically charge. While charging is taking place, the charging LED (marked with a battery symbol) will blink green. When the battery is fully charged, the charging LED will stay on a solid green.

If there is an error in charging either with a failure in the charging circuit or with a failure of the battery, the charging LED will flash red. When this happens, the battery needs to be replaced.

How to Change the Battery

In case the contained battery inside the imager needs to be replaced, please follow the procedures below:

1. Loosen the screw at the bottom of the imager.

2. Take off the battery container out of the imager.

3. Disconnect the battery cable connector from the handle board.

4. Remove the used battery from the battery container.

5. Use a new battery pack and replace the used one.

6. Place the new battery into the battery container.

7. Connect the battery cable connector to the handle board.

8. Put the battery container back to the imager handle.

9. Fasten the screw to the imager.

Note: DO NOT touch the PCBA inside the imager when replacing the battery. Improper operation may damage the imager.

Wireless Features

The SC2160W Wireless model includes an imager and a cradle. When the imager and cradle are linked together, the imager will read and decode barcodes and transmit them via a Wireless radio to the cradle. The cradle will then transmit the barcode data to the host computer over the host cable. The host interfaces available from the cradle are RS-232, Keyboard wedge, and USB as a normal corded imager.

Auto Update

When this feature is enabled, an imager and its linked cradle can automatically ensure they stay in sync with regard to firmware and/or configuration. This is accomplished by the linked imager and cradle comparing firmware version number and configuration file check sum. If either is different, the cradle will automatically update the imager with its firmware/configuration.

If the units are linked, any changes made to the cradle's configuration through the scan utility software will automatically be sent to the imager at the completion of the programming session. By the same token, any changes made to the linked imager's configuration will be transmitted to the cradle at the end of the programming session.

The following options are available for Auto Update:

- **Enable configuration and firmware auto update –** Allows both configuration and firmware updating **(Default)**.

- **Enable configuration auto update only –** Allows only configuration updating.

- **Enable firmware auto update only** – Allows only firmware updating.

- **Disable auto update** – No automatic updates will be performed.

Deep Sleep Mode

The WIRELESS imager can be placed into **Deep Sleep Mode** after this programmed duration (since the units' last scanning activity). Press its trigger to wake the imager from this mode.

- **Disable Deep Sleep Mode (Default)**

- **Duration 10 minutes** - Force imager into deep sleep mode if there is no barcode read in 10 minutes.

- **Duration 30 minutes** - Force imager into deep sleep mode if there is no barcode read in 30 minutes.

- **Duration 60 minutes** - Force imager into deep sleep mode if there is no barcode read in 60 minutes.

- **Duration 90 minutes** - Force imager into deep sleep mode if there is no barcode read in 90 minutes.

Handcuff Mode (Leash Alarm)

When enabled, the Leash Alarm will force the imager to sound an alarm for a preprogrammed length of time to notify if an imager is leaving the immediate vicinity of the cradle. This is especially useful in instances where the imager might inadvertently have been placed in a bag or cart.

- **Disable Handcuff Mode (Default)**

- **Alarm for 10 seconds when out of range**

- **Alarm for 30 seconds when out of range**

- **Alarm for 60 seconds when out of range**

Wireless Connectivity

The SC2160W can be linked to any Bluetooth (BT) enabled device which can accept such a connection with other devices. To implement this feature, user should set the imager to “Cradle/Dongle connection auto detection” first. And then set the PIN code to 0000 assigned to the target Bluetooth device. In this case, the PIN code of the Bluetooth enabled device should be set to 0000 to be identical with your imager.

- **Cradle connection only** – The imager can be used only with cradle (**Default**).

- **Cradle/Dongle connection auto detection** – The imager can be linked to either a cradle or other Bluetooth enabled devices.

- **Set PIN code to 0000**

Note: The imager only support “**Serial Port Profile**” under “Dongle connection”

Wireless Connectivity (continued)

User is also allowed to set any four- to six-character PIN code assigned to the target Bluetooth device using the setting procedures below:

STATE	CODE
Cradle/Dongle connection auto detection	 *%-1AB01%*
Program	 *%*PRO*
Begin PIN setting	 *PIN*
PIN no. (Set 4~6 character)	 ⁰ *  ¹ *  ² *  ³ *  ⁴ *  ⁵ *  ⁶ *  ⁷ *  ⁸ *  ⁹ *
End PIN setting	 *%\$\$*

Inquiry Beep Control

When the cradle is not linked to an imager, the Radio LED will blink amber and the cradle will beep. This beep can be disabled or reconfigured to sound for different durations by using the following programming barcodes.

- **Disable inquiry beep**

- **Inquiry beep continuously (Default)**

- **Inquiry beep every 10 seconds**

- **Inquiry beep every 20 seconds**

- **Inquiry beep every 30 seconds**

- **Inquiry beep every 40 seconds**

- **Inquiry beep every 50 seconds**

- **Inquiry beep every 60 seconds**

- **Inquiry beep every 70 seconds**

Cradle Beep Loudness Control

The beep loudness of cradle can be defined with the following levels.

- **Cradle beep off**

- **Level 1**

- **Level 2**

- **Level 3 (Default)**

- **Level 4**

- **Level 5**

- **Level 6**

- **Level 7**

Additional Features

Here list three additional features of SC2160W wireless imager for the convenience of use to users.

- **Download firmware from the cradle**

- **Download configuration parameters from the cradle**

- **Force cradle to reset the configuration** – This feature will also force imager to reset the configuration to factory default.

Note: To meet the regulation of air transportation, the wireless imager should disconnect with the cradle during shipment. All SC2160W wireless imagers are suggested to scan the following command before packaging into boxes and ship to customers.

Force imager to disconnect and sleep

Default setting

For each barcode shown as below:

Code Type	Read Enable	Checksum Verification Enable	Checksum Transmission Enable	Code ID

Specification

POSline SC2160W	
Specification	Model SC2160W
Operational	
Light Source	630 nm Visible Red LED
Optical System	2048 pixel CCD (Charge-coupled device)
Depth of Scan Field	Up to 600mm (CODE 39, PSC=90%, 20mils)
Scanning Width	160mm
Scan Speed	450 scans/sec
Resolution	0.1mm (4mils) Code39,PCS=90%
Print Contrast	25% or more
Scanning Angle	Front: 60° Rear: 60° Yaw: 70°
Decode Capability	Auto-discriminates all standard barcodes and some 2D symbologies including PDF-417 and RSS code; Other symbologies can be ordered optionally
Beeper Operation	7 tones or no beep
Indicator on imager	Green & Red led
Mechanical	
Length	164 mm
Width-handle	30 mm
Width-head	78 mm
Depth-handle	56 mm
Depth-head	35 mm

op

Weight	Less than 250g (with a battery)
Case material	ABS (over molded at contact points)
Cushion material	Double injection
Cradle interface	RS232, Keyboard wedge, USB
Electrical

Power - Operating (Cradle)	5 VDC
Power – Standby (Cradle)	5 VDC
Current – Operating (Cradle)	120 mA
Current – Standby (Cradle)	120 mA
Charge Current (Cradle)	550 mA
Input Voltage (Imager)	3.4V ~ 4.2V
Power - Operating (Imager)	3.2V ~ 4.0V
Power – Standby (Imager)	3.4V ~ 4.2V
Current – Operating (Imager)	225 mA
Current – Standby (Imager)	32 mA
Current – Sleep (Imager)	2 mA
Light Level	Up to 70000 Lux

Shock (Imager)	1.5m drop onto concrete
Shock (Cradle)	90cm drop onto concrete
Contaminants	Seals to resist airborne particulate contaminants (IP42)
Ventilation	None required
Programming	
Programming method	Manual (Reading special barcode), Windows configuration program
Program upgrade	Enabled by built-in flash memory
Programmable characteristics	Code type selection, check digit selection Decoding option Decoding option Transmitted character delay, Header selection, trailer selection, message suffix, good read beep tone and volume, scanner trigger selection Keyboard emulation type (intermessage delay, keyboard type and keyboard language) Serial interface type (ACK/NAK, Xon/Xoff, RTS/CTS, good read LED control, start/stop bits)

Indications of SC2160W

Imager:

	Status	Green LED	Red LED	Orange LED	Beeper
LED	Link established	Blink once			A special beep
	Loss link (handcuff mode enable)			Blink	Sound like grasshopper
	Loss link (handcuff mode disable)			Blink twice	A special beep
	Hardware fail		Flash		
	Program download	Flash			
	Program checksum fail		Flash		
	Data transmitting	ON			High freq. Beep for 300msec
	Data trans. Fail			ON for 300msec	Error beep
	Data trans. OK		ON for 200msec		Good beep
	Low battery (<3.2V) (Trigger is pressed)			Flash	

Cradle:

	Status	Green LED	Red LED	Orange LED	Beeper
RF status LED	Inquiry			Blink	Beeps once a second
	Connecting			Blink	
	Link established	ON			
	Hardware fail		Flash		
	Data receiving from the scanner			ON for 0.5sec	
	Barcode data proof or transmitted				Good beep
	Data send to the host Fail				Error beep
	Program download	Flash			
	Program checksum Fail		Flash		
	Idle				
Battery LED	Charging	Blink			
	Battery full	ON			
	Battery/charger Fail		Blink		

Programming the SC2160W

To program the SC2160W, you must scan a series of programming barcode in the correct order. Fold out the back cover of this manual. You will see a table of alphanumeric barcodes, which are used to program the various options presented.

To program each option, you must:

1. Scan the **Program** barcode on the parameter setting part.
2. Enter the option mode by scanning the **Option Bar Code** (also on the Parameter setting part).
3. To the right of the option barcode, the necessary alphanumeric inputs are listed. Scan these alphanumeric entries from the **back fold out** page. To confirm above steps, you must scan the **Finish** barcode on the back fold out page.
4. Once you have finished programming. Scan the **Exit** barcode, listed on the lower right hand corner of each parameter setting part.

Interface Selection

This cradle comes in one model and supports interfaces such as keyboard wedge, RS232 serial wedge, and USB interface. In most of the cases, simply selecting an appropriate cable with a device code will work for a specific interface.

Interface selection: You can change factory interface default for other type interface. By plugging different cables, setting right interface, then the cradle will be changed to another interface. However, you must make sure which cable you need.

Keyboard/RS232/UBS Auto detection: By setting this function, it will automatically select the Keyboard wedge or RS-232 or UBS interface for user.

Keyboard wedge

As a keyboard interface, the cradle supports most of the popular PCs and IBM terminals. The installation of the wedge is a fairly simple process without any changes of software or hardware.

Keyboard Type: Select keyboard type connector of your host computer. Cradle must be selected to the appropriate host interface cable converter.

Program

<i>Option Bar Code</i>	<i>Option</i>	<i>Alphanumeric Entry</i>
 *2AA*	IBM AT, PS/2	00 *
Keyboard type	Reserved	01
	Reserved	02
	Reserved	03
	Reserved	04
	Reserved	05
	Reserved	06

Exit

Keyboard wedge

Keyboard Layout: The selecting of keyboard layout supports many country languages other than USA keyboard layout. First you need to confirm country language that you desire. In DOS, using command “keyb” to select the desirable keyboard layout or in WINDOWS entry “Control” then pops “Keyboard” to select country at “language” item. For details, please refer to your DOS or WINDOWS user’s manual.

Keyboard Speed: By selecting, you can change output speed of data transmission to match with host computer. Generally, set 00 or 01 in working high speed. If some output characters of barcode have been lost, you may need to set 05 or 06 to match your host keyboard speed.

Function Key: Set Enable, imager can output code as pressing function-key in your application program while the barcode datas contain ASCII value between 01₁₆ to 1F₁₆. Refer to ASCII table.

Numeric Key: The Keypad has to be selected if your application program is only keypad numeric code acceptable. So, cradle will output code as press numeric keypad when it read numeric digit. (The keypad is in the right side of keyboard, and Num Lock control key is also on.) If Alt+Keypad is selected, the data characters will be transmitted as “Alt” + numbers. For example, when sending character “A”, the actual sending will be “Alt”+65. It is also useful when using non-English OS and keyboard layout.

Keyboard wedge

Caps Lock: By selecting `Caps lock"ON"` or `Caps lock"OFF"`, imager can get Caps Lock status.

Power-on simulation: All of the PCs check the keyboard status during power-on selftest. It is recommended to `Enable` function if you are working without keyboard installation. It simulates keyboard timing and pass keyboard present status to the PC during power-on.

Inter-character delay: This delay is inserted after each data characters transmitted. If the transmission speed is too high, the system may not be able to receive all characters. Adjust it and try out suited delay to make system work properly.

Block transmission delay: It is a delay timer between barcode data output. The feature is used to transfer continually with shorter barcode data or multi-field scanning.

RS-232

CTS: Clear To Send (Hardware Signal)

RTS: Request To Send (Hardware Signal)

Xon: Transmit On (ASCII Code 11₁₆)

Xoff: Transmit Off (ASCII Code 13₁₆)

Flow control:

None-The communication only uses TxD and RxD signals without regard for any hardware or software handshaking protocol.

RTS/CTS-If the cradle wants to send the barcode data to host computer, it will issue the RTS signal first, wait for the CTS signal from the host computer, and then perform the normal data communication. If there is no replied CTS signal from the host computer after the timeout (Response Delay) duration, the imager will issue a 5 warning beeps.

Xon/Xoff- When the host computer is unable to accept data, it sends a Xoff code to inform the cradle to suspend data transmission, and Xon to continue.

ACK/NAK- When the ACK/NAK protocol is used, the cradle waits for an ACK (acknowledge) or (not acknowledge) from the host computer after data transmission, and will resend in response to a NAK.

Inter-character delay: It is delay time between data character's data output. It is also same as Inter-char. delay of keyboard wedge.

Block transmission delay: It is a delay time between barcode data output. It is also same as Block transmission delay of keyboard wedge.

Response delay: This delay is used for serial communication of the cradle to waiting for handshaking acknowledgment from the host computer.

Scan

Scanning mode:

Good-read off-The trigger button must be pressed to activate scanning. The light source of imager stops scanning when there is a successful reading or no code is decoded after the Stand-by duration elapsed.

Momentary-The trigger button acts as a switch. Press button to activate scanning and release button to stop scanning.

Alternate-The trigger button acts as a toggle switch. Press button to activate or stop scanning.

Timeout off-The trigger button must be pressed to activate scanning, and imager stops scanning when no code is decoded after the Stand-by duration elapsed.

Continue-Imager always keeps reading, and it does not matter when trigger button is pressed or duration is elapsed.

Test only-For test of scan performance only. It is improper to be utilized to check the accuracy of transmitted data.

Double read timeout: The imager will require a several times successful decoding to confirm the data when enabled. The more confirming times required, the more inhibitive miss-reading code will be shown. The Multi field scan Enable function won't be able to work if set Double confirm.

Double confirm: If the barcode has been scanned twice, then only the first barcode will be accepted.

Supplement Check Counter: It will be more reliable to read the barcode with extension (supplement) like UPCE/A or EAN-8/13, but slow down the decoding speed when this counter is set more.

UPCA

Insertion group number selection: The imager offers max. two insertion groups for one symbology. By setting one or two digits to indicate which insertion group you want to insert. You may refer to Character insertion. The function is to insert specific characters as a group into transmitted data of selected symbologies. Enable the group insertion by selecting the group number.

Example: Group 2 → set 02 or 20.

Group 1 and 4 → set 14 or 41.

Notes 1): Group number set to “0” means that no group insertion required.

2): Details about the Insert Group settings please refer to page 117~120, and page 126 ASCII code table.

Supplement digits: The Supplement digits barcode is the supplemental 2 or 5 characters for WPC code.

Format

Leading Zero	Data Digits (11 Digits)	Check Digit	Supplement Digits 2 or 5 or UCC / EAN 128
-----------------	----------------------------	----------------	---

Truncation / Expansion: The leading “0” digits of UPCA data characters can be truncated when the function is enabled.

Code 39

Read: Format

Start “★”	Data Digits (Variable)	Checksum (Optional)	End “★”
--------------	----------------------------	------------------------	------------

Check-sum verification: The checksum of Code-39 is optional and made as the sum module 43 of the numerical value of the data digits.

Check-sum transmission: By setting Enable, checksum will be transmitted.

Max./Min. code length: Each symbology has own Max./Min. Code Length. They can be set to qualify data entry. If their Max./Min. Code Length is zero, the Global Min./Max. Code Length is in effect. The length is defined as to the actual barcode data length to be sent. Label with length exceeds these limits will be rejected. Make sure that the Minimum length setting is no greater than the Maximum length setting, or otherwise all the labels of the symbology will not be readable. In particular, you can see the same value for both Minimum and Maximum reading length to force the fixed length barcode decoded.

Truncate leading/ending: Refer to Truncate leading/ending of UPCA.

Code Id setting: Refer to Code ID setting of UPCA.

Code 39

Insertion group number selection: Refer to page 51
Insertion group number selection of UPCA.

Format: The Full ASCII Code-39 is an enhanced set of Code-39 that is the data with total of 128 characters to represent Full ASCII code. It is combined one of the digits +, %, \$ and / with one of the alpha digits (A to Z).

Append: This function allows several symbols to be concatenates and be treat as one single data entry. The imager will not transmit the embedded appending code (space for Code-39). If Enable and other symbols were read again with the appended code, then codes will be transmitted without Code ID, Preamble and Prefix. When a symbol was decoded without the appended code, the data will be transmitted without Code ID and Prefix, but the Postamble Suffix codes are appended. This function is used when the first number of code 39 is a space. Example: □123456.

Start/end transmission: The start and end characters of Code-39 are "★". You can transmit all data digits including two "★".

String setting / Transmission (Prefix / Suffix)

Prefix / Suffix characters setting: Characters defined as prefix or suffix characters will be transmitted immediately with the scanned data for all symbologies. Up to 22 ASCII characters can be defined as Prefix or Suffix.

Format of barcode data transmission:

\$%+PRO

Program

Option Bar Code	Option	Alphanumeric Entry
 *8AA* Prefix characters setting	None 1-22 characters	00 * 00-ffH ASCII code
 *8AB* Suffix characters setting	None 1-22 characters	0D * 00-ffH ASCII code

%\$\$

Exit

String setting / Transmission (Preamble/Postamble)

Preamble/ Postamble characters: Preamble or Postamble characters will be appended to the data automatically for all symbologies. However, the transmission will not activate unless **Preamble / Postamble transmission** is enabled.

Preamble transmission: By setting Enable, Preamble will be appended before the data transmitted.

Postamble transmission: By setting Enable, Postamble will be appended after the data is transmitted.

Example:

Add a prefix/suffix or preamble/postamble for all symbologies. In this example, you are sending a \$ symbol as a prefix for all symbologies.

Steps:

- 1) Scan Programming and Prefix characters setting barcode.
- 2) Use the ASCII code table to find the value of \$→24.
- 3) Scan 2 and 4 from the barcode on the fold out back page.
- 4) Scan Finish from the barcode on the fold out page.
- 5) Scan Exit barcode.

String setting / Transmission (Insert Group Characters)

Insert G1/G2/G3/G4 character setting: The imager supports inserting two groups with each group 22 characters into transmitted data of selected symbologies. The two groups can be inserted into scanned data of the selected symbologies or positioned at leading / ending of data. There are total four groups for utilization.

Insert data group position: To define the position of a group to insert into bar code data. Please notice that the inserting position of a group must not exceed the code length; or the insertion will be positioned at the ending of data.

Notice: Default value "00" indicates the group to be positioned at the leading of data. "64" represents for positioning the group at the ending of data.

Insert data group setting procedure:

- i. **Define the characters of groups for insertion.**
- ii. **Setup the inserting position of each group in scanned data.**
- iii. **Select one or two groups to insert into specific bar codes. Please refer to the setting pages of each bar code.**

Example: Barcode "1 2 3 4 5 6".

Output- Barcode "1 2 A B 3 4 C D 5 6".

Steps:

- 1) Scan Programming and Insert G1 characters setting barcode.
- 2) Use the ASCII code table to find the value of A→41, B→ 42.
- 3) Scan 4, 1 and 4, 2 from the barcode on the fold out back page.
- 4) Scan Finish from the barcode on the fold out page.

5) Repeat the same procedure in Insert G2 characters setting.

6) Scan Exit barcode.

- 1) Insert data group 1-4 position. Please refer to the specific barcode that you want to use.
- 2) **Insert data group 1-4 position:** The imager offers 4 positions to insert among the symbol. The position default value is "00" to indicate no character insertion. Beside, make sure insertion positions are not greater than the symbols; otherwise the insertion data is not effective.

Program

Option Bar Code	Option	Alphanumeric Entry
 Insert G1 characters setting	1-22 characters	"GROUP1" * 00-ffH ASCII code
 Insert G2 characters setting	1-22 characters	"GROUP2" * 00-ffH ASCII code
 Insert G3 characters setting	1-22 characters	"GROUP3" * 00-ffH ASCII code

 *8AH* Insert G4 characters setting	1-22 characters	"GROUP4" * 00-ffH ASCII code
 *6AC* Insert data group 1 position	00-64 (00: no insertion)	00-64 00 *
 *6AD* Insert data group 2 position	00-64 (00: no insertion)	00-64 00 *
 *6AE* Insert data group 3 position	00-64 (00: no insertion)	00-64 00 *
 *6AF* Insert data group 4 position	00-64 (00: no insertion)	00-64 00 *

Exit

String setting / Transmission (Others)

Code ID position: Upon your usage, the transmitting position of Code ID can be selected to place Before Code Data or After Code Data when it is transmitted.

Code ID transmission: If your application is needed to transmit Code ID, you must set this to Proprietary ID or AIM ID.

Code length transmission: A number of data digits can be transmitted before the code data when Enable is selected. The total length of the barcode is the number of barcode data except Truncate Leading/Ending Digits. And the length is a number with two digits.

Code name transmission: This function is to show unknown barcode symbologies that include all readable symbologies of the imager. When Enable is selected, Code Name will be transmitted before code data, you will know what kind of barcode symbology is.

Case conversion: Setup the scanned data characters to be transmitted all in upper case or lower case. For example: If upper case is selected, "12aBcDeF" will be converted and transmitted to host as "12ABCDEF".

Program

Option Bar Code	Option	Alphanumeric Entry
-----------------	--------	--------------------

 *6AG* Code ID position	Before code data After code data	00 * 01
